Claims:

1. An embankment block, comprising:

a base fame having a center with a through hole; and

a plurality of connection members that are downwardly extended from an outer surface of a rim of the base frame and have outwardly bent connection parts at the front ends of the same.

2. The block of claim 1, wherein a plurality of holes are formed in the rim of the base frame wherein said holes are vertically through by a partition plate.

3. The block of either claim 1 or claim 2, wherein said connection member is outwardly widened in the outer side direction of the rim of the base frame.

4. The block of either claim 1 or claim 2, wherein a reinforcing rib is formed in a longitudinal direction in an inner surface of the connection member.

5. The block of either claim 1 or claim 2, wherein a connection hole is formed in the connection part of the connection member for connecting the corresponding embankment blocks.

6. The block of claim 5, wherein a front end of the connection part of the connection member has a narrow width, and a guide part is formed at a rear end of the connection part for thereby guiding the front end of the connection part in such a manner that it is overlapped with the connection part of the corresponding other embankment block.

7. The block of either claim 1 or claim 2, wherein an engaging protrusion is formed in a lower surface of the connection part of the connection member of one side among a plurality of connection members, and an engaging hole is formed in a lower surface of the connection part of the connection member of the other side wherein the engaging protrusion of the corresponding same embankment block is inserted into the engaging hole.
